IP Phone Systems by Design

Xtelesis IP Telephony Solution - Shoreline Communications Systems

Voice over IP — voice communications delivered via the Internet Protocol — sends voice information digitally in discrete packets rather than using the dedicated circuit-switched protocols of the public switched telephone network (PSTN). One big advantage of this is that it bypasses the toll structure of conventional phone service. More generally, because it uses digital information sent over data networks, VoIP offers the same efficiencies, conveniences, and opportunities for integration as other IP-based digital technologies — such as email, directory services, and the web. VoIP leverages existing IP networks to support voice communications across the LAN and WAN, enabling businesses to connect a globally distributed workforce — from overseas sales offices to telecommuting executives — with a unified, cost-efficient phone system.

To provide the state of the art in IP telephony — reliable, cost-effective, easy to use and administer — Xtelesis has partnered with **Shoreline Communications**, a leading provider of enterprise-class VoIP solutions.

VoIP leverages existing IP networks to support voice communications across the LAN and WAN, enabling businesses to connect a globally distributed workforce — from overseas sales offices to telecommuting executives — with a unified, cost-efficient phone system.

The Shoreline4 VoIP system is a completely distributed, modular voice communications solution layered on top of your existing IP network. At its heart is a standards-based architecture that distributes call control intelligence to voice switches connected anywhere on the IP network, and distributes

voice applications — including voicemail and automated attendant — to servers across locations.

The result is a **single-image system** for all locations and all voice applications. In place of the multiple PBXs, voicemail systems, automated attendants, and ACD systems painfully familiar to users and administrators of traditional enterprise phone systems — all with their multiple management interfaces — the Shoreline system is distributed, the voice applications are bundled, and the management interface is integrated.

Are you interested in **seeing the Shoreline system in action**? Contact Xtelesis to schedule a Shoreline Demo. An Xtelesis Network Consultant will arrive on-site at your location and set up a live Shoreline system. You can see for yourself why **Shoreline was rated #1 by customers in Nemertes Research study**.

Contact a Network Consultant at 888-340-9835 or email sales@xtelesis.com.
